

Clasp Fixing:

Proceed as followed:

1- Center the clasp on the gate post

2- Apply pressure on the metal so that the two small pitons on the back of the clasp print the wood

- 3- Drill the marks left by the pitons with the proper drill without going through the door.
These pitons will avoid the clasp to move

- 4 - Replace the clasp and pencil mark the other two holes to be drilled

- 5- This time drill while crossing thru the gate door, again careful to take the proper drill before drilling

- 6- Place the clasp so that the peaks return to their location
7 - Install the fasteners to be used with the stem (see below fixing strap)

8 - Insert the handles

- 9 - Fixing fasteners and handles with a piece of wood:
Once attached, the two legs of the fasteners to be used with the bolt will be cut.
However the handles legs can be curved as shown here on the back of the door

10- The end:

In case of any issues during the clasp fixing process, please contact us.

We wish you a good day.

Warmly
CDC Team
